Year 8 History: Industrial Revolution Poster

Inspired by inventors from the UK and the Middle East!

Your task:

Create a Poster/Pamplet from the below inventions including information from their inventors. Be sure they are neat and in colour and ready to present.

Due: Last Week of Term 1

Invention 1: Steam Engine (1776)

James Watt made crucial improvements to the steam engine, making it more efficient and practical for use in factories and transport.

Why it's important: *Watt's steam engine powered factories, ships, and railroads, revolutionising work and transportation.*

Invention 2: Astronomical Clocks and Steam Turbine (16th century)

Taqi al-Din Developed one of the first steam turbines and intricate clocks, showing the potential of steam and mechanical timing.

Why it's important: *His work in mechanics and steam influenced later European developments in the Industrial Revolution.*

Invention 3: Flying Machine Concept (1760's)

Ahmed Al-Jawhari was an inventor who came up with the idea of a flying machine based on glider principles. Though the actual device was basic, it was one of the early recorded attempts to explore human flight.

Why it's important: His ideas on flight, showed early experimentation with aerodynamics, which helped develop flying technologies in the modern era.

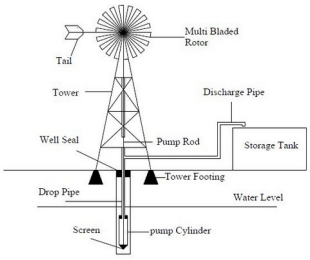

Invention 4 : Wind-Powered Water Pump (1770s)

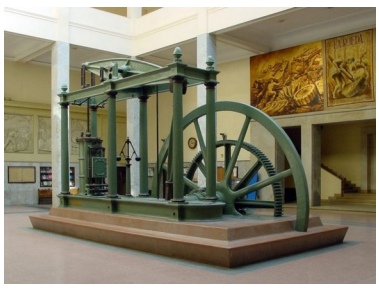

Abdallah al-Sharif designed and constructed wind-powered water pumps for agricultural irrigation purposes in Egypt, using early mechanical engineering principles. His device improved crops in areas where traditional methods were inefficient.

Why it's important: This invention helped improve agricultural productivity, one of the key focuses during the Industrial Revolution, though it came from outside Europe.

Year 8 History Extension: Create Your Own Industrial Revolution-Inspired Invention! (Optional)

Inspired by inventors from the UK and the Middle East!

Create your own design of the below inventions. You can also select from any invention created between 1750-1900. Reward points and the best will be selected for display at Open Day

Invention 1: Steam Engine (1776)

James Watt made crucial improvements to the steam engine, making it more efficient and practical for use in factories and transport.

Why it's important: *Watt's steam engine powered factories, ships, and railroads, revolutionising work and transportation.*

Invention 2: Astronomical Clocks and Steam Turbine (16th century)
